Summary

Data is organized in a hierarchical structure based on dates to facilitate efficient retrieval. I faced several challenges throughout the assignment and was able to resolve most of them with additional help from the TA and LLM. However, in the end, the metastore failed to load. I attempted to use MySQL as an alternative, but that also didn't work. Due to repeated errors on Windows machines, I opted for external tables in Hive to avoid reloading data in case of failures and to enable direct updates in HDFS. Raw tables stored data in CSV/JSON format, while the star schema tables were stored in Parquet to reduce storage space and improve query performance. Overall, the execution time was relatively fast, with most commands completing in seconds.
